STIC Search Report

EIC 2800

STIC Database Tracking Number: 164442

TO: T. Chowdhury
Location: JEF-4A49
Art Unit : 2871
Wednesday, August 31, 2005
Case Serial Number: 10/721,361

From: Jeff Harrison
Location: EIC 2800
JEF-4B68
Phone: 22511

Search Notes

Attached are edited results from patent literature in CAS/STN and in EAST foreign patent text/image databases, and from WWW searching.

I recommend that you browse all the attached results.

If you would like more searching on this case, or if you have questions or comments, please let me know.

Respectfully,
Jeff Harrison

 AB US2004105045 A UPAB: 20040723
 NOVELTY - The assembly has an insulator provided rectangular at one side
 of a home appliance with a guide along an edge of the insulator. A
printed circuit board (6) is loaded inside the
 guide. A coating layer is applied on the board. A **liquid**
crystal display panel is provided over the
 coating layer. A set of **recesses** (630) are formed along edges of
 the insulator, the board, the layer and the panel.
 USE - Used for a home appliance (claimed) e.g. washing machine.
 ADVANTAGE - The **LCD** assembly improves the structure of the
 recess of the **printed circuit board** to
 prevent interruption between the **printed circuit**
board and the **bosses** coupled with the **LCD**
 panel, thereby fixing the **printed circuit**
board in accurate locations.
 DESCRIPTION OF DRAWING(S) - The drawing shows a layout of a recess on
 a **printed circuit board**.

 NOVELTY - An **LCD (Liquid Crystal Display)**
 assembly of household electric appliances is provided to prevent an
LCD from bending or transforming by removing stress from the
LCD through push is given on an upper surface of the **LCD**
 .
 DETAILED DESCRIPTION - An **LCD (Liquid**
Crystal Display) assembly of household electric appliances
 includes an insulator(5), a **printed circuit**
board, coating liquid and an **LCD**. The insulator as a
 square plate has a coating guide downward a rim of a lower surface. A
boss (520) and a support rib (510) for combining the **LCD**
 is protruded from an upper surface of the insulator. The **printed**
circuit board is installed inside the coating guide on
 the lower surface of the insulator. Coating liquid applies to cover an
 upper surface of the **printed circuit board**.
 The **LCD** is combined and fixed to the **boss** for
 combining the **LCD**. Therein, the **LCD** is not given with
 stress through pushing force is applied to an upper surface of the
LCD.

 The arrangement is located on an operating and **display**
panel formed by a frame carrying a **circuit board**
 held by a support. The **circuit board** has a selection
 switch (1) connected to the appliance's microcomputer and via a coupling
 mechanism to a control knob.
 The coupling mechanism has one element (3) on the spindle (2) of the
 switch and another (10) on the knob and also has elements for
 automatically adjusting, fixing and centering the knob during assembly.
 One coupling element (10) is a disc (14) with centering and fixing
 elements (17,18). The other coupling element (3) is a spring disc (20)
 with **recesses** for the said centering and fixing elements.
 ADVANTAGE - Compensates for mfg. tolerances.

AB PROBLEM TO BE SOLVED: To obtain a display quality excellent in shock resistance by firmly keeping the engagement between a mold case and a light **guide** plate.
SOLUTION: The device is equipped with a frame mold case MCA which houses a back light BL disposed on the back face of a liquid crystal panel PNL and with a metal frame SHD which forms the frame to expose the effective display region of the liquid crystal panel and which has side walls extended to the mold case side to **fix** the mold case. The back light BL consists of a light **guide** plate GLB of an almost **square** transparent plate and a linear light source CFL disposed along one side of the light **guide** plate, and has an engaging projection SSTP formed on each of two sides of the light **guide** plate perpendicular to the linear light source. The mold case has an engaging recess ALV on each of two sides perpendicular to the linear light source so as to engage the engaging projection formed on each of the two sides of the light **guide** plate and has a **bridge** BRDG to connect the two sides where the engaging **recesses** are formed.

 NOVELTY - Curved portion (2c) of electrode lead (2) of **liquid**
crystal display element (1) and grooves (7) in a holder (8)
 separate the electrode lead from a case (3). The curved portion is formed
 at backside of a guide portion (2e) formed at the edge of electrode lead
 for guiding lead inside an insertion hole (11) provided in the
circuit board (4). DETAILED DESCRIPTION - The case has a
boss (9) connected to a through hole (13) penetrating the front
 and back of the **circuit board**. The **liquid**
crystal display element is arranged on a mounting portion (6) of
 the case.
 USE - For **liquid crystal** display element.
 ADVANTAGE - Prevents generation of crack in soldering region of
 electrode lead and **circuit board** due to stress or
 thermal expansion. Improves assembling speed by separating electrode lead
 from case when connecting case with **circuit board**.
 Fixing of case on **circuit board** can be done properly.
 DESCRIPTION OF DRAWING(S) - The figure shows the perspective view of the
 mounting structure of the **liquid crystal** display
 element. (1) **Liquid crystal** display element; (2)

ICS G09F009-00; **G02F001-1333**
AB PROBLEM TO BE SOLVED: To prevent uneven display caused by the heat of a
liquid crystal display panel by
constituting a thermal diffusion plate using a resin frame and a metal
fitted into the frame and mounting this plate on a casing via this frame.
SOLUTION: The casing is internally provided with a core 13 as the thermal
diffusion plate. This core 13 supports a tablet 2a and the **liquid
crystal display panel** 2b on the upper side
thereof and supports a **printed circuit board**
6 on the lower side. An aluminum sheet 14 is fitted into the resin frame
15. The resin frame 15 integrally has ribs 15 for supporting the tablet 2a
and the **liquid crystal display panel**
2b on its front surface, **bosses** 5b for fixing a **printed
circuit board** 6 and detaining pieces 15c for detaining
the core 13 itself to the inside wall of the casing. The heat generated
from electronic parts including the **LCD** driving element on the
printed circuit board 6 at the time of driving
a notebook type personal computer is once accepted in the aluminum sheet
14. The aluminum sheet 14 uniformly distributes the accepted heat by
thermal conduction and releases the heat to the **liquid
crystal display panel** 2b.

NOVELTY - The light guide plate (224) has thin projections (224a',224b') on the side walls of the catching jaws (224a,224b) formed at the corners facing the lamp (221). The mold frame (400) has **recesses** beside catching **bosses** (402a,404a) to receive the projections of the light guide plate during assembly.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for liquid crystal display (LCD) device.

USE - For computer monitor, TV and other display device.

ADVANTAGE - Restricts the movement of light guide plate received in mold plates and prevents its damage even if exceeded impacts are applied on the side walls of the mold frame. The projections are formed to have slopping shape preventing the concentration of light from the lamp.

DESCRIPTION OF DRAWING(S) - The figure shows the exploded perspective view of light guide plate and mold frame.

AB PROBLEM TO BE SOLVED: To miniaturize a camera by superposing and attaching an **LCD** and a **printed circuit board**

inside the external covering member of the camera, forming **recesses** on the covering member for avoiding the contact of an element mounted on the **printed circuit board**

with the covering member, and narrowing the spacing between the covering member and a presser member.

SOLUTION: The recess 67 is formed inside a rear cover 51, and the **LCD** 54, a light transmission plate 55 and a flexible substrate 56 are fitted in this recess 67 in order. The **LCD** 54, the light transmission plate 55 and the flexible substrate 56 are fixed by screwing a presser plate 57 to the rear cover 51. On the flexible substrate 56, elements 64 and 65 are mounted at the position where they do not overlap with the light transmission plate 55. The **recesses** 67 and 69 for avoiding contact of the elements 64 and 65 are formed on the rear cover 51.

NOVELTY - An insulator (1) with a narrow mediate section and positioning **recesses**, has an end face protruded with a chamfered latch **boss**, and sides formed with opposite longitudinal recessed sockets having a bottom and an adjoining side with an inverted T-shaped through-hole (13). The integrated multiple board locks (2) has a U-shaped pivot portion with a flexible locking tab (23) passing through the through-hole, such that it rests on an end face of the hole.

USE - For connecting a connector and a printed circuit board.

ADVANTAGE - As the through-hole has the inverted T-shape, the board lock is quickly and accurately inserted into the insulator, the assembling process is facilitated, the components and cost are reduced. As the locking tab rests on the end face of the through-hole, the board lock is prevented from moving outward and the quality of the product is enhanced. The narrow mediate section and the positioning **recesses** allow the conductors to be locked and positioned effectively, the tilting of the conductors, breaking of the receptacle are prevented.

DESCRIPTION OF DRAWING(S) - The figure shows an exploded perspective view of the fixing structure for connecting the connector and the PCB.

 NOVELTY - U-shaped frame (3) has the **bosses** (3f,3g) to fit into the holes (4a,4b) of an insulating sheet (4). Another set of **bosses** (3a,3b) are formed on the back side of the frame to fit into the holes (2a,2b) of the **printed circuit board** (2) so that the board is connected to the frame.
 DETAILED DESCRIPTION - An insulating sheet (4), back light and the **LCD** module (7) are piled up and are installed on the front side of the frame (3). The terminal of the back light is soldered to the land (2c). The spacer (6) adjoins the insulating sheet and the back light and is so distributed that the front side of the frame and the **LCD** module are bonded directly. The holes (4a,4b) of the insulating sheet exist on both sides of the terminal of the back light bonded by the insulating sheet.
 USE - Electronic device with display window.
 ADVANTAGE - Portable mounting efficiency of the components is high. Provides weight reduction and high reliability of the display back light. Stress to the terminal of the back light is reduced and removal of the back light from reuse is simple.
 DESCRIPTION OF DRAWING(S) - The drawing is the exterior perspective diagram of the electronic device with the display part.

NCL 313512; X313500; X313511

AB A structure for mounting an EL (Electro Luminescence) lamp of the present invention includes a panel frame affixed to a **circuit board** and receiving an **LCD (Liquid Crystal Display) panel** therein. The EL lamp is interposed between the panel frame and the **LCD panel** and includes an electrode portion connected to the **circuit board** by electrode terminals. Holes are formed in the EL lamp in the vicinity of the electrode portion and open at opposite major surfaces of the EL lamp. **Bosses** are formed in the panel frame, and each is partly received in one of the holes. Even when an unexpected impact acts on the **LCD panel**, the **bosses** prevent the EL lamp from moving in the horizontal direction. This successfully protects the electrode terminals from breakage due to fatigue and prevents them from being peeled off from the EL lamp, enhancing reliable connection both mechanically and electrically.

NOVELTY - The method comprises the creation of conducting **bosses** on a plastic support (5). This is done by **stamping** the support, when hot, with a metal foil sheet (3) arranged above it, using a template (1). The upside-down integrated circuit is mounted on the **bosses**

DETAILED DESCRIPTION - The template tool (1) for **stamping** the support (5) has small cavities corresponding to the positions in which the conducting **bosses** will be created in the plastic support. As the support is hot when **stamped**, it flows into the cavities within the template (1), with the metallic foil forming conducting **bosses** on top of the **bosses**.

USE - For fabrication of flip chips, or integrated circuits mounted on a plastic support with the connections on the face opposite to the plastic support, in which thickness of the integrated circuit lies within the depth of the cut out of the plastic support.

ADVANTAGE - The method provides a simple and more economical means of producing the plastic chip support, and for mounting the chip on its support.

DESCRIPTION OF DRAWING(S) - The figure shows a side sectional view through a chip support, during its formation

NOVELTY - V-Shaped **recesses** are formed at the side end face of a **printed circuit board (PCB)** (6) and connected to conductive pattern (12), in which electrode wires (5) of cold cathode tube (3) are inserted and soldered.

USE - For **liquid crystal** displays used in computers and television.

ADVANTAGE - Since recess is provided at the side end face of **PCB**, soldering of wire is made easy.

DESCRIPTION OF DRAWING(S) - The figure shows an explanatory view of connection structure of **printed circuit board** with cold cathode tube.

The junction box (100) has two chambers (104,106). A sheathed cable (20) enters one of the chambers (106) through a hole (26) passing through a **boss** (24) formed in the chamber wall. The cable is clamped by a tapered ring (32) that fits into a tapered recess in the inside of the **boss**. This deforms the **boss** so that it is clamped tightly around the cable insulation, forming a seal.

The cable is then stripped inside the enclosure and connection (21,23) made to metal spring contacts (108,110) set in **recesses** in the wall (102) that divides the junction box.

USE/ADVANTAGE - Simplified, low cost assembly for sealed junction boxes for batteries or for electric lighting assemblies.

ABEQ US 5403976 A UPAB: 19950524

An end piece is provided for passage of an electrical power supply cable through an orifice of a casing. The end piece includes a flexible bearing flange cooperating with an auxiliary securing part arranged as a hollow button having a clamping surface in the shape of a rigid wedge bringing about elastic deformation of the flange.

Progressive clamping of the cable is carried out when the button moves from a released position to a secured position. The securing part of the passage is an integral part of the insulating wall supporting the contacts.

ADVANTAGE - Simplifies assembly of tight passage of electrical cable, and enables part of passage to be used for auxiliary functions.

ABEQ EP 589804 B UPAB: 19960428

A tightly sealed casing made of plastic material for housing an electrical apparatus, comprising a first wall (22) equipped with an end piece (24) for the passage of a power supply cable (20) through an orifice (26), and sealing means designed to seal off the clearance arranged between the orifice (26) and the external face of the cable (20), characterized in that the end piece (24) of the casing (10, 100, 200) comprises a flexible bearing flange (28, 42), arranged around the cable (20) when the latter is inserted in the orifice (26), an auxiliary securing part (30) is tightened onto the end piece (24) bringing about elastic deformation of the flange (28, 42) and a simultaneous clamping action of the cable (20) in the sealing zone, a clamping surface (32) of said securing part (30) in the shape of a rigid wedge cooperates with the flange (28, 42) to ensure progressive clamping of the cable (20) when relative movement of said part (30) takes place from a released position to a secured position, the securing part (30) is securedly united to a second insulating separating wall (102, 202) supporting an electrical component (108, 110, 206) arranged inside the casing (100, 200).

At least one conductor plate is traversed by parts of the **stamp** grid. The baseplate (10) consists of at least two plate parts (30, 32, 34, 36) which can be connected to one another. In or between the plate parts **recesses** (40, 42, 44) are formed for the parts of the **stamp** grid cross through the baseplate (10). One plate part (30) has pin locations or pin projections which work in conjunction with pin projections or pin locations on the other plate part (32). The **recesses** are complementary to the accommodated parts of the **stamp** grid. The plate parts are welded to one another e.g. by ultrasound.

At least one part of at least one **stamp** grid has a contact spring fitted on to it, and this spring with the grid part or alone forms a pin accommodation for a counter pin.

ADVANTAGE - Current circuit monitoring, using a control appts. in which **stamp** grid is connectable to baseplate rapidly.

AB PROBLEM TO BE SOLVED: To enhance the mechanical strength of fitting foot parts of a casing without increasing the number of foot parts and without thickening the thickness of a plate by formingly providing ribs for reinforcement at the bending angular part between the side face of the casing and a fitting foot part.

SOLUTION: A fitting foot part 11 is made to be protrudingly provided from the edge part of the side face 10a of a casing 10 parallel with the principal plane of the casing 10 by bending a metallic plate at the same time the casing 10 is formed by bending and working the plate. Moreover, ribs for reinforcement 15 are formingly provided at the vertical angular part between the side face 10a of the casing 10 and the fitting foot part 11, for example, by a die-**stamping** working at the same time of bending working of the fitting foot part 11 or a different working. the rib for reinforcement 15 is made so that the outside is a projecting shape and the inside is a recessed shape. However the fitting foot part 11 is fixed to the **boss** 12 of a main devices side with a washer 13 and a screw 14, even when the stress due to the falling shock of the main body is exerted on the part 11, since it is mechanically reinforced, it is not brought to be damaged and therefore circuit parts mounted on a liquid crystal device are also protected.

AB GB 2282527 A UPAB: 19950518

The mounting frame for an **appliance** cabinet, comprises a lower plinth (1), and upper cover plate (2), and parallel posts (3) of equal length extend between the plinth (1) and the cover plate (2). The frontal surfaces (4) of the posts (3) on two sides have securing bores (5), and the plinth (1) and the cover plate (2) carry groups of securing holes (6). The plinth (1) and the cover plate (2) are rigidly connected with the posts by using securing **screws** (7) which project through the securing **holes** (6) and engage in the securing bores (5). The plinth (1) and the cover plate (2) are formed essentially of a securing plate (8) having a **rectangular** contour which carries the groups of securing **holes** (6).

On one of the longitudinal sides (9) of the plinth (1) and of the cover plate (2), two front arms (10) project perpendicularly forwardly and form a front recess (10) between themselves. At the opposite longitudinal sides (11) of the plinth (1) and of the cover plate (2), two rear arms (12) project perpendicularly out and form a rear recess (12') between themselves. The front and rear arms (10 and 12) are formed on the ends of the longitudinal sides (9 and 11), and each of a front and a rear flange (10 or 12) are **aligned** with each other.

USE/ADVANTAGE - For **appliance** cabinets for receiving electrical, electronic and opto-electronic components in connection with the erection and operation of local networks where large thicknesses of cabling, utilising cables of larger diameter, are employed. All requirements for the unhindered supply of a large number of cable strands of low flexibility can be fulfilled in the region of mounting of the electric/electronic elements.

ABEQ US 5441337 A UPAB: 19950927

The mounting frame (1) includes side (2), floor (3) and ceiling (4) panels, a stand, a rear wall (5) and a door (6), all disposed on a support base and a cabinet base (7). Also provided are a rectangular frame having two vertical frame legs (8,9) with horizontal upper (10) and lower (11) connectors which serve as the stand. Two upper (15,16) and two lower (17,18) forward support arms protrude from the front side of the frame, and two upper (20,21) and two lower (22,23) rear support arms protrude from the rear side.

All of the support arms are attached in the region of the frame corners. They are disposed parallel to one another and perpendicular to the plane of the frame. The side, floor and ceiling panels, rear wall and the door are disposed on the support arms.

USE/ADVANTAGE - For construction and operation of local network, installing structural group carriers, housings of electronic and optoelectronic components requiring high density and their accessories. Free access of cables and cable strands into installation region of components.

ABEQ US 5488543 A UPAB: 19960315

A frame stand for a device cabinet serving in the installation of component carriers of industrial electronics, and which is provided with panels, comprising: a lower base plate; an upper lid plate; parallel posts of equal length extending between the base plate and lid plate, the end faces on both sides of the posts have fastening bores; said base plate and lid plate having groups of fastening holes; said base plate and lid plate being **fixedly** connected to the posts by fastening **screws** which pass through the fastening **holes** and extend into the fastening bores; said base plate and lid plate being essentially formed by a fastening plate which has a **rectangular** base outline and groups of fastening **holes**; two front brackets that form a front **recess** between themselves and projecting at a right angle to the one longitudinal side of the base plate and the lid plate; two rear brackets arranged on the opposite longitudinal side of the base plate and lid plate, said rear brackets forming a rear recess between themselves and projecting at a right angle; said front and rear brackets being formed onto the ends of the longitudinal sides; and, one front and one rear bracket are **aligned** respectively with one another.

ABEQ GB 2282527 B UPAB: 19970502

A mounting frame for an **appliance** cabinet, the cabinet serving for mounting sub-racks of the electronics industry and provided with enclosure panels, the frame having the following features - a lower plinth (1), - an upper cover plate (2), - parallel posts (3) of equal length which extend between the plinth (1) and the cover plate (2), - the frontal surfaces (4) of the posts (3) on two sides having securing bores (5), - the plinth (1) and the cover plate (2) carry groups of securing holes (6), - the plinth (1) and the cover plate (2) are rigidly connected with the posts by means of securing **screws** (7) which project through the securing **holes** (6) and engage in the securing bores (5), - the plinth (1) and the cover plate (2) are formed essentially of a securing plate (8) having a **rectangular** contour which carries the groups of securing **holes** (6), - on one of the longitudinal sides (9) of the plinth (1) and of the cover plate (2) two front arms (10) project perpendicularly forwardly and form a front recess (10) between themselves, - at the opposite longitudinal sides (11) of the plinth (1) and of the cover plate (2) two rear arms (12) project perpendicularly out and form a rear recess (12') between themselves, - the front and rear arms (10 and 12) are formed on the ends of the longitudinal sides (9 and 11), - each of a front and a rear flange (10 or 12) are **aligned** with each other.
